

➤ **PRODUCTS** ➤ **CONTAINERS** ➤ **rotomoulded containers**

These plastic containers in the rotomoulded procedure are made of the powdered, dyed PE raw material. With simultaneous warming up and centrifuges of the material by centrifugal force an extreme compression at the walls is obtained - particularly in the corners. This lends the extraordinary firmness, which can be otherwise obtained by no other procedure to the container. It does not surprise therefore that these container types are used particularly in the military range.

The vantages:

- very large range in different forms available (no additional tool costs)
- rotomoulded containers can be produced in extraordinary long and high dimensions
- different standard colours available

**optional equipment:**

- pressure compensating valve
- adress holder, lockable traps
- wheels, vats
- hygroscope
- lash rings
